Subject: Standards for the inter-university progress test in medicine

The fail-pass standards were determined by calculating the mean minus standard deviation for the results of the three last progress tests for each total measurement-moment group and then fitting a curve through the obtained points. The height of the fit curve provides the standards used for each measurement moment.

The pass-good standards are determined in a similar way: in this case, mean+0.5 x standard deviation per total measurement-moment group is first calculated and then a curve is again fit through the obtained points. The height of the fit curve provides the standards used for each measurement moment.

Standards inter-university progress test February 2023

<i>Measurement moment</i>	<i>Fail-Pass Standard</i>	<i>Pass-Good Standard</i>
1	-10,80	11,14
2	-4,34	16,08
3	1,35	20,50
4	6,38	24,45
5	10,80	27,98
6	14,71	31,13
7	18,15	33,95
8	21,19	36,47
9	23,87	38,71
10	26,23	40,72
11	28,31	42,52
12	30,14	44,12
13	31,76	45,55
14	33,19	46,83
15	34,44	47,97
16	35,55	49,00
17	36,53	49,91
18	37,39	50,72
19	38,15	51,45
20	38,82	52,10
21	39,42	52,68
22	39,94	53,20
23	40,40	53,67
24	40,80	54,08

As the inter-university progress test in Medicine involves full cooperation with the UMCG (Groningen), the UMCN (Nijmegen), the LUMC (Leiden) and the Vrije Universiteit Amsterdam (VUmc), it has been agreed with the partners that a measuring moment group is defined as the total measuring moment group (LUMC, UM FHML-G, UMCG, UMCN and VUmc) that participated in the iPTM.
